

Chapter II

Consensus and Vision | < Return to the original state of blockchain >

Consensus of BTCs

Generate

Consensus is a very precious intangible asset. Once solidified, it is indestructible. Many of the mainstream currencies on the market are consensus currencies. Consensus is also very rare and rare.

The birth of the consensus of BTCs itself is a kind of accident, which coincides with the right time, place and people.

If placed at other times, BTCs may not generate consensus. Fortunately, after the Ordinals Pandora's box was opened, ORDI hit the exchange all the way, BRC-20 was silent, and there was no major innovation in Ethereum. I was tired of playing the dull period when the plate was annoying, and I followed the example of Ordinals and made an ethscription Period, it appeared!

If it is not on the BRC-20 track, not on the Satoshi engraved on Bitcoin, but on other chains such as Ethereum, b n b chain, etc., BTCs will definitely not have a strong consensus. On Bitcoin, it appears!

If it is not a united and powerful community at the beginning, if BTCs is occupied by short-term speculators from the beginning, BTCs may not have a consensus. Fortunately, Chongtugou's smart money didn't like it. In front of a powerful community, it appeared!

If it is not on the BRC-20 track, not on the Satoshi engraved on Bitcoin, but on other chains such as Ethereum, b n b chain, etc., BTCs will definitely not have a strong consensus. On Bitcoin, it appears!

If it is not a united and powerful community at the beginning, if BTCs is occupied by short-term speculators from the beginning, BTCs may not have a consensus. Fortunately, Chongtugou's smart money didn't like it. In front of a powerful community, it appeared!

If you switch to other BRC-20 tokens, there is no consensus. Therefore, the consensus itself is a bit metaphysical and cannot be forced.

Consensus can be optimized and evolved over time. The initial consensus of Dogecoin was to satirize the currency circle, and later it developed into a small coin with reward culture, and later it belonged to one of the unowned currencies that people summed up.

Other tokens of BRC-20 are not necessarily unowned currencies, which may contain the selfishness of the deployers, and a lot of them have been secretly played. Some people say that ORDI pioneered the BRC-20. It is the leader and the small cake. There are fewer and fewer people who fall down and call him small cake. The main reason is that ORDI was banned when it was listed on the exchange. The beliefs of ordinary people are established when they rise, and they collapse when they fall. The BTCs community is not willing to compete with it, but thanks to ORDI for letting people know BRC-20, and is willing to inject new blood to help BRC-20 and Ordinals ecology. Let the BRC-20 ecology flourish again, so BTCs is not exclusive, but altruistic.

A thousand reader with a thousand Hamlet. More and more people in the community call BTCs Xiaobing or the second prince. I don't think it matters. It is because people found that BTCs love it that they gave it various titles.

If Bitcoin is digital gold, then BTCs are 21 million bright pearls embedded in some Satoshi gold. Of course, BTCs brings vitality to BRC-20 and Ordinals, and there are other treasures to be discovered as well.

People who like BTCs must also have Bitcoin, and their trading actions are liked by miners. And people who like BTCs may also like other digital treasures inscribed on Bitcoin. BTCs is good for the entire Bitcoin ecology.

The consensus of BTCs is growing quietly every day, which cannot be separated from the efforts of the community of pulling together. This is the same as the Bitcoin community preaching at the beginning, so many old Bitcoin OGs in the past have participated. This is really a matter of luck. I studied the traces of the old people in the circle who worked hard to preach on Weibo and Tieba before and after 2013, which is a bit similar to today's community. Having participated in various projects and played hundreds of

tokens, it is rare to see such a strong consensus like BTCs. Although we don't know where BTCs will end up, we are full of hope.

Difficulty

On the road of evangelism, there are bound to be various obstacles. The same is true for studying the history of Bitcoin. Just because Bitcoin can still do this in the face of international suppression, it makes us believe in the original blockchain. Just like when BTCs first preached, he will inevitably encounter various twists and turns. I have experienced the familiar group closures, fuds due to selling or missing fuds, being fuds by other communities, someone who got off the car prematurely and called back fuds, doing other internal sales, and the community is out of step. But after these opposites, the consensus of the community has become stronger. This is the charm of BTCs itself.

Today, we still operate BRC-20 in a thin order form, which feels inconvenient. But really don't look at the problem with a static eye. Before the emergence of uniswap, all digital currencies were basically order book transactions, and transactions did not have currency transactions. There will be technological breakthroughs in the future. Taking a step back, it is not important for BTCs to realize the exchange on the chain. It is also the carrier of consensus! Carrier of value!

Expand and Consolidate

Anyone with a certain degree of awareness will recognize BTCs. Not preaching to him sooner would just miss him.

Cognition has no national boundaries. As long as they understand it, they will become loyal fans and firm believers.

BTCs, like most tokens, will spiral up when it becomes a huge consensus body. The people who come to participate in each stage are different.

In the beginning, it was a group of newcomers and on-chain explorers. They made a discovery.

Later, some small funds entered the market, and the number of addresses gradually increased, forming a

primary scale.

With further development, there will be large funds entering the market, and the number of addresses will further increase. The chips are gradually being gathered by big capital.

Eventually some whales and institutions will come in and play. form a very large liquidity.

After the consensus grows, it is often caught up by other projects. For example, imitation disk and so on.

This just strengthened the consensus.

The whole process is also a process of consensus consolidation, and the consensus will become very stable and irreversible.

At this time, the BTCs that grow up may become the target of the hoarders. Become a new mainstream currency.

BTCs Vision

As BTCs grows, the number of addresses continues to increase. Some people get off the car, some people get on the car, and some hold on firmly without looking at the price. It all depends on how different people define it. In the beginning, no one cared about it. Later it was said to be a plate, and later someone said it was a golden dog. But few people see that it may be the mainstream currency in the future, competing with LTC.

Some people say that BTCs is air, is it so noble to say it? If it is air, isn't LTC air? Isn't Doge air? Isn't even BTC air? Isn't the sovereign property air? Are borders not air?

Some people say that BTCs is Ponzi, if it is Ponzi, isn't the US dollar Ponzi? Isn't real estate Pond's? Are pensions not air?

One thousand Ponzis is called a Ponzi scheme, and ten million Ponzis should be called a Ponzi structure. Pond's is not terrible, it depends on how big it is.

BTCs represent the spirit of the original blockchain. It is a bottom-up anti-establishment, anti-p u a punk spirit. Its consensus self-adjusts over time and various events will eventually become the currency on

Bitcoin.

The world economy is facing a protracted Great Depression. Under the expectation of continued interest rate hikes in the US dollar, Bitcoin is facing a crisis of lack of liquidity. After the reduction of Bitcoin production in 2024, the liquidity of miners still has not improved. The miners who maintain the security of the Bitcoin network face the price drop of Bitcoin and shut down one after another. The overall computing power decreases, and the security of the Bitcoin network decreases. Block rewards and transaction fees are the two incomes of miners. The consensus of BTCs can reactivate the Ordinals ecology, increase the income of absenteeism, and maintain the security of the Bitcoin network.

We cannot predict that 2025 will be a big bull market. If the bull market really comes, Bitcoin must rise first. The cottage danced along.

The fundamental reason why altcoins can rise is that after Bitcoin has risen, it relies on narrative to obtain liquidity overflow and rise. As people awaken to the essence of cryptocurrency, more and more people will agree with BTCs, which will form a solid consensus and harvest a large number of loyal believers against the establishment.

How much storage capacity will the BTCs growing in your own body have in the future? Its valuation may even surpass that of LTC, becoming another unclaimed currency of the new pie lineage. Overwhelm the surrounding altcoins and give priority to absorbing the liquidity overflow of Bitcoin.

DOGE foreign vassals have become mainstream currencies.

LTC said that Bitcoin is gold, and it is silver. It has been a long time since it was said.

But do you choose these huge altcoins that have already formed and have little room for growth, or choose BTCs with pure blood and huge future potential like BTCs?

Some people believe it when they see it. Some people believe and then see. This is the difference between people.

Vision determines vision, vision determines action.

Stock up on BTCs and walk on the road to wealth and freedom!

To hoard BTCs, you first need to learn the entire history of cryptocurrencies and understand the current status of cryptocurrencies. Recognize the essential attributes of BTCs. If you don't even know that it is a bottom-up currency that is completely safe and fair to everyone. You will only get lost in its curve-growing chasing ups and downs.

Of course BTCs is an extremely challenging cryptocurrency experiment. And with the risks, there is also the possibility of failure. The current contradiction is mainly: the height of cognition and the time when the chips are evenly distributed!

For large currency holders, if there is such a consensus, the chips should be distributed and more people get on board. The cake is big, and the proportion is small, but you can enjoy great wealth.

For retail investors, after establishing long-term beliefs, they must master the technology of hoarding BTCs and buy in small batches. Hoarding coins is a long process.

When BTCs was at \$0.001, they said, out of sight.

When BTCs was at \$0.05, they said, it's too cheap.

When the price of BTCs was 0.1 US dollars, they say that it is a plate and a dog.

When BTCs was \$1, they said, it was too expensive.

When BTCs cost \$10, they say, it's too expensive.

BTCs always seem to be too expensive, and they are never willing to buy them.

When BTCs is \$0.001, we say it's early.

When BTCs is \$0.01, we say it's early.

When BTCs is \$0.1, we say it is still early.

When BTCs is \$1, we say it's early.

When BTCs is \$10, we said, it was early.
